

Asexual Reproduction

Did you know?

Although most animals do not practice asexual reproduction, a few do. Flatworms, a parasite in humans and other animals, can reproduce sexually or asexually.

In this activity, you will design an investigation of any type of asexual reproduction.

- 1. Write a Question** Think about what interests you in the different ways organisms can reproduce asexually. Write a question that will be the basis of your investigation.

- 2. Form a Hypothesis** Based on what you know about asexual reproduction, what do you think the answer to your investigation question will be? Write your hypothesis.

- 3. Develop a Method** Decide the best method to use to answer your investigation question. What will you look for? Write your method.

- 4. Collect Data** How will you measure the results? Describe your data-collection plan.

- 5. Plan for Problems** Describe how you will deal with a potential problem with the investigation.
