Lesson Outline

LESSON 2

Asexual Reproduction

- **A.** What is asexual reproduction?
 - _____, one parent organism produces offspring without meiosis and fertilization.
 - **2.** Because the offspring of asexual reproduction inherit all their DNA from one parent, they are genetically ______ to each other and their parent.
- **B.** Types of Asexual Reproduction
 - **1.** Cell division in prokaryotes is known as ______
 - **2.** During fission, DNA is ______ and the cell splits to form two identical offspring. The original cell no longer exists.
 - **3.** Many unicellular ______ reproduce by mitotic cell division. In this type of asexual reproduction, an organism forms two offspring through mitosis and ______.
 - **4.** In ______, a new organism grows on the body of its parent by mitosis and cell division. When the bud becomes _____ enough, it can break from the parent and live on its own.
 - _____ occurs when an offspring grows from a piece of its parent.
 - **a.** Sea stars, sea urchins, sea cucumbers, and planarians can
 - _____ through regeneration. **b.** Many animals can ______ damaged or lost body parts.
 - This is not reproduction; ______ are not produced.
 - _____ is a form of asexual reproduction in which offspring grow from a part of a parent plant.
 - is a type of asexual reproduction developed by scientists and performed in laboratories. It produces _____ individuals from a cell or from a cluster of cells taken from a multicellular organism.
 - **8.** Using a cloning method called ______, plant growers and scientists can use a meristem to make a copy of a plant with desirable traits.
 - **9.** Because all of a clone's _____ ____ come from one parent, the clone is a genetic copy of its parent.

Lesson Outline continued

10. Asexual reproduction enables organisms to reproduce without

a(n) ______.

- **11.** Asexual reproduction also enables some organisms to rapidly produce a large number of ______.
- **12.** Asexual reproduction produces offspring that are genetically identical to each other and to their _______. This results in minimal genetic ______ within a population.
- **13.** Genetic variation is important because it can give organisms a better chance of _______ if the environment changes.
- **14.** Genetic changes, called _______, can occur and then be passed to offspring; this can affect the offspring's ability to survive.
