

Weather

"Layers of Life"

Intro

Water comes rushing through pipes and out the tap,

Or you can buy a bottle for a dollar and a half.

So easy to get here in the U.S.A.,

We don't blink if it doesn't rain for days.

But there's places worldwide,

Where water would save lives,

And _____ means people die.

Covers most of the globe, like it's all I see,

Go for four days without it, and it's R.I.P.

A little heat from the sun is all it takes

To evaporate oceans, puddles, ponds and lakes.

Water _____, turns to _____,

It rises through the air, like "see y'all later."

In the upper atmosphere, the air is cold,

So the gas turns back into liquid fast.

That's _____, and it causes clouds,

"I don't get it, why don't clouds fall down?"

'Cause clouds are made of tiny water drops,

As warm air rises, it keeps the clouds aloft.

And stops the drops from falling down,

But if they "freeze!" they "get on the ground!"

'Cause when clouds get thicker and bigger,

That triggers large drops to fall like "timber!"

That's _____, and it might be rain,

It might be hail or snow if it's very cold.

Three layers of life, I'll make it clear:

The one we live on? That's the _____.

The one with the water is the _____.

The gas and air is the _____.

"I have a question: why do we have air we can breathe here?

Why doesn't air just float away into space?"

Well, air is something that you can't see,

But like you or me, it's held down by gravity.

Held down like wrestlers when they're not on top,

I'll change the air pressure, make your ears go pop.

Air's thicker near the bottom, and it's thin up top,

Like a dude with fat legs and a big bald spot.

We measure this barometric pressure with a barometer,

Like we measure heat with a _____.

Now, the bottom layer is the _____,

It contains 90% of the air.

The _____ above that contains the _____,

Protects us from those harmful rays.

_____ is so cold, the air is so thin,

_____ 's above that, and that's the end.

Um, surprise, sunrise, here comes the sun,

Bringing heat with that _____.

It brings heat and energy to defeat its enemies,

Makes your car hot, and heats the air.

That makes the air move oh-so-much better.

This is a _____ current; it creates weather,

_____ coming! Get your Dairy Queen Blizzard.

Which — hurricane, thunderstorm, or _____ — is it?

Three layers of life, I'll make it clear:

The one we live on? That's the lithosphere.

The one with the water is the hydrosphere.

The gas and air is the atmosphere.
